

GREEN PAINT SYSTEM
Reduce, reuse, recycle

GREEN PAINT SYSTEM

The renewed painting system uses an ultra-thin PET liner. Using recycled Polyethylene terephthalate (PET) puts us a green step ahead as a company. Even more so because we use an incredible 40-50% less plastic to produce our flexible inner cups compared to the average liner by our competitors on the market. Looking at a European market of a tremendous 150 million produced systems, this is a significant amount of saved plastic.

Did you know that PET ensures minimal friction with the paint, more chemical resistant than LDPE and collapses a lot faster than LDPE? In this way, the unique PET liner does not only leave less paint residue in the liner and reduces the weight of plastic waste but on top of that ensures you at all times in a perfect color match.

Closing cap

- Store leftover paint easily

GPS 00

Lid

- Lightweight lid with integrated strainer

PET-liner

- Ultra thin PET-liner
- Up to 50% thinner compared to traditional systems
- Highly transparent for accurate mixing
- Less friction resulting in better paint flow
- Easier and faster collapsing than LDPE and therefore faster paint release out of the liner

Reusable outer cup

- 10 different mixing ratios
- Optimized height-width dimensions for more accurate measuring

UP TO 50% LESS PLASTIC IN 5 STEPS!

5

RECYCLE & REPEAT

Not all recycling companies are able to reprocess these products into usable plastic. For the plants that are not yet able to realise this process, there is an alternative solution: instead of burning the waste, they use it as fuel for baking processes (such as bricks). All materials that have been recycled are delivered to us as recycled raw materials and the cycle starts all over again.

4

WASTE DISPOSAL

Thanks to the reusable outer cup, there is already one item that you do not need to throw away. If the cup does need to be disposed of due to use, it goes into the recycled polypropylene process. The PET liner and lid are supposed to be removed according to local regulations.

1

MATERIALS

The new paint system consists of 3 basic raw materials: recycled PET, recycled PP (polypropylene) and virgin PP (polypropylene).

reuse

2

PRODUCTION PROCESS

The recycled PET is transformed into the PET-liner. During this process, there is a lot of surplus which we reuse to produce more PET-liners without waste. 30% of the plastic remains after punching the Pet-liner and this 30% will be fully recycled again.

3

PRODUCT

These three components make up our 'Green Paint System'. Recycled raw materials, re-usable materials and recyclable end treatment make this system ecological and innovative, putting us several steps ahead of our competitors.

ASSEMBLE YOUR SPRAY GUN IN 4 EASY STEPS

1

STEP 1

- Place the flexible liner in the firm, printed outer cup
- Measure and mix your paint into the cup system
- Press and twist the lid onto the outer cup, sealing the liner between the outer cup and the lid

2

STEP 2

- Select and install the proper adaptor fitting your gun
- Push the spray gun with adapter onto the system and secure it by a quarter twist
- Connect the air hose to the spray gun

3

STEP 3

- Turn the spray gun upside down
- Hold the trigger to release remaining air until paint comes out

4

STEP 4

- Turn the system upright
- Regulate your air pressure and you are ready to spray

3D VIDEO

STORE

- Press the closing cap on the lid and turn upside down

DISPOSE

- Dispose when completely empty (according to local regulations)

THE NEXT INNOVATION

Innovation is more than just a technical improvement. Innovation is progress, the chance to do something better or do something that was previously said to be impossible.

Our new Finixa Paint system is certainly innovative in that respect. The renewed system uses an ultra-thin PET liner. Using recycled Polyethylene terephthalate (PET) puts us a green step ahead as a company. This is enhanced by the fact that we use an incredible 40-50% less plastic to produce our new flexible inner cups. That is, compared to the

average liner by our competitors on the market. Looking at a European market of a tremendous 150 million produced systems, this is a significant amount of plastic that we can prevent from being used.

The combination of the step construction inside the outer cup, which ensures that the liner is perfectly positioned and sealed, and our highly compressible liner ensures a very smooth experience during and after spraying.

Today, the car industry is still seen as a very polluting sector. Step by step, we are trying to compensate or improve this where we can. To this end, we are bringing real ecological innovations, such as our renewed paint system. Together we are building a brighter tomorrow.
